9+ YEARS IN BACKEND / 650K USERS / 24-SERVER PLATFORM / ~2K AI REQUESTS / MONTH

01 PROFILE

Backend engineer and technical lead with 9+ years in PHP/Laravel. Joined Maltina as a senior developer and moved into the lead role four months later. Still hands-on with architecture, code reviews, incidents and releases. Recent focus: practical AI automation that removes repetitive work and is useful in production.

02 AI IN PRACTICE

- Built a production support assistant around OpenAI and Anthropic APIs, RAG/vector search, human approval and audit logs.
- It handles roughly 2,000 tickets a month. Most users now get an answer in 5-10 minutes instead of waiting as long as a day; around 10% of cases go to a person.
- Use Claude Opus/Sonnet and OpenAI Codex daily for architecture drafts, refactoring, debugging, tests, reviews and legacy migrations. Build multi-agent workflows with MCP and tools when one agent is not enough.

03 EXPERIENCE

Maltina / Karaj, Iran

Technical Lead

Dec 2023 - Present

- Lead a six-person product team across backend, frontend, product, QA and DevOps, with final sign-off on architecture, technology choices, pull requests and releases. Also handle production incidents.
- The platform serves 650K users and carries 15M products. Its footprint is 14 API servers behind HAProxy, six frontend servers, a four-node MySQL cluster and about 50 GB of data.
- Designed the software and deployment approach while DevOps handled infrastructure implementation. GitLab CI, Docker/Docker Compose, health checks, rollback and backward-compatible migrations keep releases zero-downtime.
- Black Friday traffic reached about 10,000 active users in Google Analytics. The platform stayed online with no outage.
- Work directly with the CEO and Product Manager on roadmap, estimates, sprint priorities and infrastructure costs. Break roadmap work into estimates, sprint plans and release decisions.
- Interviewed 50 candidates and hired five. Run six-month performance reviews; two people were promoted and three took on larger roles.

Senior Backend Developer

Aug 2023 - Dec 2023

- Built order synchronization in Laravel and MongoDB, with status changes moving across purchasing and fulfillment in real time.
- Moved 10 modules and three services from PHP 7.4/Laravel 7 to PHP 8.2/Laravel 11 in two weeks. The rollout had no downtime, improved average speed by about 5% and left the codebase easier to change.
- Reworked financial flows to close security gaps and remove race conditions.
- Connected Laravel and Python services through RabbitMQ for multi-vendor purchasing and background work.
- Built reusable address/location modules and a driver-based currency service with Redis caching.

04 EARLIER WORK

Zoop / Karaj, Iran

Senior Backend Developer

May 2021 - Aug 2023

- Moved a Yii2 telemedicine product to a modular Laravel codebase and mentored four developers through the migration.
- Containerized local and production services with Docker/Docker Compose and set up Nginx and Netdata for operations and monitoring.
- Added real-time communication with Soketi and Laravel broadcasting and built administrative workflows with Livewire.
- Integrated Elasticsearch through Laravel Scout to improve search and retrieval.

Borna Education / Karaj, Iran

Launch-Stage Co-Founder & Developer

Apr 2021 - May 2021

- Co-launched a vocational training institute and built its Laravel/Livewire platform for students, instructors, classes, attendance, tuition and payments, supporting 500+ users.
- Built the student portal for schedules, attendance and tuition payments, plus an MBTI test and automated birthday messages.
- Taught practical computer skills to 45 students across four terms.

Zaryad & selected freelance work / Tehran / Remote

Backend Developer

Jul 2017 - Apr 2021

- Built and maintained the PHP/Laravel/MySQL backend for Zaryad's children's education app, used by 1,000+ people, and integrated external APIs.
- Delivered the Care4Us telehealth API, WebSocket-based doctor-patient messaging and payment integration.
- Refactored the Idro backend and built the Laravel backend for the Hello7 Android app.
- Moved KanoonApp from vanilla PHP to Laravel and delivered additional small-business web work.

05 TOOLBOX

Backend: PHP 8.x, Laravel, Symfony, Livewire, Laravel Octane, REST APIs

Data: MySQL, PostgreSQL, MongoDB, Redis, Elasticsearch

Delivery: Docker, Docker Compose, GitLab CI, HAProxy, Nginx, RabbitMQ, MinIO, Netdata

Architecture: Modular systems, microservices, API design, concurrency, SOLID, design patterns, TDD

Applied AI: OpenAI/Anthropic APIs, RAG/vector search, MCP, multi-agent workflows, human approval and audit

Leadership: Roadmap, hiring, mentoring, estimation, reviews, incidents and release decisions

Languages: Persian - native / English - upper-intermediate
